

The highest quality manufacturing techniques, surface treatments, tests and quality assurance reviews are always expected by our international mining customers.

These standards are no challenge to the team of experienced welders, certifiers, project managers and QA managers on staff who are well versed in exceeding the strictest expectations.

Quite a large number of our mining customers have often requested that we manufacture to multiple standards and always expect the highest quality finished product.

Maxcon Industries is often engaged to manufacture large complicated steel pieces used in material handling like mineral hoppers, conveyors, silos and storage bins.

We also specialise in the manufacture of underground mine ventilation fans and shafts, large chemical storage tanks and numerous other smaller mine site fabrication requirements, including serviceable items.
